

CampusPilot

Autonomous AI system for campus
complaint handling — from plain-text
report to resolved ticket, no human
triage required.

Hackathon submission · 2026

Campus complaints go nowhere

- A broken projector, a leaking pipe, whatever — students report it in plain text, however they'd naturally describe it
- Someone has to read every report, work out what it is, how urgent it is, and who's responsible
- Without an owner or a deadline, reports go stale and nobody follows up

How it works

01

From complaint to resolved ticket

One agent classifies and prioritizes; the pipeline creates the ticket, routes it, and keeps checking back until it's resolved.

Three agents, one pipeline

Triage agent

Reads the plain-text complaint and works out what it is and how urgent it is — no forms, no dropdowns.

Routing agent

Creates the ticket and assigns it to the team responsible for that kind of issue.

Follow-up agent

Watches open tickets and nudges the assigned team if nobody handles it in time.

Built on

Frontend

A React app — the one interface students and admins both use, to submit complaints and manage tickets.

Backend

Node.js APIs, plus the AI agents that do the triage, routing, and follow-up.

Database

Exasol — a real database behind every ticket, not mocked data.

Three pages, one flow

PAGE	WHO USES IT	WHAT IT DOES
/	Students	Submit a complaint in plain text
/dashboard	Admins	Resolve tickets, trigger follow-up
/ticket/:id	Anyone with the link	View a single ticket's status

Working end to end

- Complaint submission, AI triage, and ticket creation are live
- The admin dashboard resolves tickets and triggers follow-up
- Everything runs against a real Exasol database — nothing mocked

Thank you

Watch the demo or dig into the code —
frontend, backend, and the agents are
all in the repo.
